

Package ‘bnclassify’

June 22, 2015

Title Learning Bayesian Network Classifiers from Data

Description Algorithms for learning Bayesian network classifiers from data.

Version 0.2.0

URL <http://github.com/bmihaljevic/bnclassify>

BugReports <http://github.com/bmihaljevic/bnclassify/issues>

Depends R (>= 3.2.0)

Imports

assertthat (>= 0.1),entropy(>= 1.2.0),crossval(>= 1.0.2),graph(>= 1.42.0),matrixStats(>= 0.14.0),pryr(>= 0.1.1),RBGL
8)

as_mlr	<i>To mlr</i>
--------	---------------

Description

To mlr

Usage

```
as_mlr(x, dag, id = "1")
```

awnb	<i>Compute feature weights according to the AWNB method.</i>
------	--

Description

Compute feature weights according to the AWNB method.

Usage

```
awnb(class, dataset, bootstrap_size = 0.5, trees = 10)
```

car	<i>Car Evaluation Data Set.</i>
-----	---------------------------------

Description

Car Evaluation Data Set.

Format

A data.frame with 7 columns and 1728 rows.

Source

<http://sourceforge.net/projects/weka/files/datasets/UCIandStatLib/uci-20070111.tar.gz>

chowliu	<i>Chow-Liu ODE.</i>
---------	----------------------

Description

Chow-Liu ODE.

Usage

```
chowliu(class, dataset, score = "loglik", blacklist = NULL, root = NULL)
```

Arguments

class	character
dataset	data frame
score	character
blacklist	character matrix
root	character

cv	<i>CV</i>
----	-----------

Description

CV

Usage

```
cv(x, dataset, k, dag, smooth = NULL)
```

family	<i>Gets the parents of a node in the graph</i>
--------	--

Description

Gets the parents of a node in the graph

Usage

```
family(x, g)
```

fssj	<i>Learns Bayesian network classifiers in a wrapper fashion.</i>
------	--

Description

bsej is the backward *sequential elimination and joining* algorithm whereas fssj is the *forward sequential selection and joining* algorithms for learning a semi-naive Bayes classifier (Pazzani, 1996). tanhc Learns a tree augmented naive Bayes with a greedy hill-climbing search. tanhc is the super-parent variant of tanhc.

Usage

```
fssj(class, dataset, k, epsilon = 0.01, smooth = 0.01)
```

```
bsej(class, dataset, k, epsilon = 0.01, smooth = 0.01)
```

```
tanhc(class, dataset, k, epsilon = 0.01, smooth = 0.01)
```

```
tanhc_sp(class, dataset, k, epsilon = 0.01, smooth = 0.01)
```

Arguments

class	A character. Name of the class variable.
epsilon	A numeric. Minimum absolute improvement required to keep searching.

lp	<i>Learn parameters.</i>
----	--------------------------

Description

Learn parameters.

Usage

```
lp(x, dataset, smooth)
```

makeRLearner.bnc	<i>makeRLearner</i>
------------------	---------------------

Description

makeRLearner

Usage

```
makeRLearner.bnc()
```

predict.bnc_bn	<i>Predict.</i>
----------------	-----------------

Description

Ties are resolved randomly.

Usage

```
## S3 method for class 'bnc_bn'  
predict(object, newdata, prob = FALSE, ...)
```

predictLearner.bnc	<i>Predict.</i>
--------------------	-----------------

Description

Predict.

Usage

```
predictLearner.bnc(.learner, .model, .newdata, ...)
```

to_grain	<i>To grain</i>
----------	-----------------

Description

To grain

Usage

to_grain(x)

trainLearner.bnc	<i>Train.</i>
------------------	---------------

Description

Train.

Usage

trainLearner.bnc(.learner, .task, .subset, .weights, ...)

voting	<i>Congress Voting Data Set.</i>
--------	----------------------------------

Description

Congress Voting Data Set.

Format

A data.frame with 17 columns and 435 rows.
